

VITRU.VIEWS

SEE CITIES AT HUMAN SCALE

TYPE: Generative AI

YEAR: 2026

TEAM: Andrea Cutroni & Elena Corio

FACULTY: James McBennett and Aymeric Brouez

CONTEXT: IAAC Master in Advanced Computational Design (MACAD)

vitru.views is a generative AI tool that transforms real street views into greener, more human-centered scenarios. By removing clutter, adding vegetation and pedestrian space, and applying architectural style and lighting, it enables fast, context-aware visualizations. Integrated with a map-based interface, it helps planners, municipalities, and citizens imagine more livable, human-scale urban futures. The goal isn't just a pretty render. It's about making possible futures visible.

Have you ever imagined what your city would look like if it were designed for people, not cars?

A generative AI web application that turns real street views into greener, people-first futures.

WORKFLOW

ITERATIONS

It allows users to navigate a map, select a location, choose a camera angle and generate an AI image showing what the place could look like with fewer cars and more greenery. The 3-step FLUX workflow is based on a LoRA trained on Henning Larsen urban design projects.
